About HKIFM

The Hong Kong Institute of Facility Management (HKIFM) is a non-profit making organisation inaugurated in 2000. It was formed by a group of professional people who are actively involved in the field of facility management. The Institute is run by an elected Council that has a number of committees covering aspects on membership, education, corporate affairs, research and communications.

What is Integrated Design Process (IDP)?

The IDP is proposed as an effective way towards a holistic collaborative design paradigm for sustainable building. The IDP Conference cum Workshop differs from recent seminars and conferences introduced by the profession such as the sustainable building conference and the urban sustainability conference that focuses on new design knowledge. The IDP Conference cum Workshop focuses on how to manage and most importantly integrate design information. The IDP Conference cum Workshop targets on the management techniques more than particular design technologies.

Objectives of the SIDP Conference

1. A framework for design-input coordination throughout different stages of a building procurement process: design inception, feasibility study, scheme design, project design, project documentation and construction.
2. A study of the culture of design practice, perceived as inherent differences due to biases imbedded in specific professional disciplines. For instance, a building design concept may be generated from a symbolic reference while the same might also be generated from technical or functional references. Both approaches might lead to completely different built forms and constructions. The process of design according to an Architect could be a non-systematic, haphazard or even an erratic approach that contrasts with an Engineer's step-by-step, or production-line process, for argument sake. Failure to understand how each other think and work presents a blockage against any attempts for an integrated design and hence disadvantages the product. The author has come across many instances in which the blockage could also be experienced within a multi-disciplinary professional practice.

Objectives of the SIDP Workshop

The study is extended to address the culture of a localised dynamic user market environment that is more responsive to demands for socio-economic changes rather than new and technological changes. For a developing economy, personal preoccupation that is associated with materialistic pursuits might explain the minimalist lip-service paid by real estate developers or project managers to implementing innovative design ideas and engineering techniques that focused on sustainability.
